

Logistics (CMC)

Visibility and control of your world-wide equipment stock

CMC allows you to take control of your world-wide equipment stock simply and efficiently. It manages stocks of any size including dry vans, special equipment, chassis, trailers, gensets and others. CMC easily differentiates between equipment that is owned by you, owned by the shipper or leased from a third-party.

CMC is a powerful tool that provides an accurate and easy-to-understand picture of your global equipment stock. It shows the equipment located in each terminal or depot as well as those items released to clients. It distinguishes between those containers that are empty or full, it shows units that are damaged and, crucially, which are available and which are booked.

An overview facility gives an instant and up-to-date picture of your world-wide equipment stock and a drill-down function provides the detail. CMC handles unlimited movements and readily differentiates between owned and leased boxes. Movement history is easily monitored and illogical sequences are automatically highlighted to provide an instant quality check.

Leased containers

CMC provides a complete solution for leased boxes. The application manages contracts, calculates expected leasing costs and analyses leasing invoices giving you a tight control over your leasing expenses. The application manages leasing terms and rates and keeps a complete record of all on-hires, off-hires, direct interchanges and subleases giving you tight control over your leasing expenses.

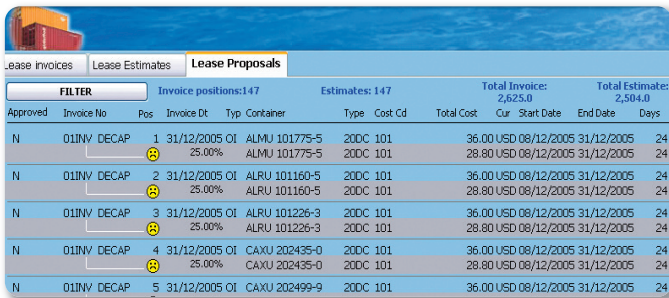

Up-to-date equipment history

Information relating to each movement is received from quay operators, stevedores and forwarders and sent directly to the CMC application. Data is imported automatically without the need for manual intervention with the help of standard EDI interfaces or simply through spreadsheets. This reduces errors, duplication and ensures your equipment stock report is updated as quickly as possible.

Container Sum - Depot		Container Sum - Location			Container Sum - Group		Container Sum -

Lease invoice reconciliation

Importantly, CMC enables leasing invoices to be auto-matically entered using EDI. Once input, they are reconciled based on your contracts with the leasing company to highlight actual versus expected amounts. This reduces time and resources spent on administration, it improves accuracy and it eliminates any possibility of over-billing

Storage and handling

CMC will track every container movement in and out of the depot or terminal and monitors the associated storage and handling fees. Invoices are automatically input to the system allowing fast and efficient reconciliation. Up-to-date information and complete visibility of your storage and handling costs allows invoices to be agreed with the minimum of resource.

Demurrage and detention

Calculating demurrage and detention fees per box and per customer is an important feature of CMC. Standard rates and free-day arrangements as well as highly individual agreements by location, customer and/or actual shipped container volume are all supported.

Once demurrage or detention is chargeable, invoices are automatically generated taking all these bespoke agreements into consideration. This significantly increases revenues from overdue equipment with minimal workload.

Business Benefits

- Maximises the use of your equipment stock through tighter control
- Reduces duplication, errors and disputes
- Improves your cash-flow through regular automated invoicing for demurrage and detention
- Allows fast and efficient reconciliation of supplier invoices with minimal resources
- Generates management information, reports and statistics to give business transparency
- Fast and easy reporting of container activities from depots and terminals

Key Features

- Container History
- Stock control
- EDI data upload
- Lease equipment control
- Demurrage/detention billing
- Storage/handling control
