LIMPIEZA Y MANTENIMIENTO PIEZAS METALIZADAS

REJUNTADO

La operación de rejuntado tiene gran importancia para el resultado final del revestimiento cerámico, tanto desde el punto de vista técnico como estético. El rejuntado debe realizarse con materiales desarrollados específicamente para esta finalidad definidos y clasificados en la norma UNE EN 13888.

Al ser un producto delicado, se debe rejuntar con mucho cuidado, intentando no sobresalir por encima del material cerámico para evitar mancharlo.

- * El rejuntado se realizará transcurridas al menos 24 horas desde la colocación de las piezas cerámicas.
- * La aplicación del material de rejuntado se realizará según las instrucciones del fabricante.
- * Generalmente utilizaremos un material de rejuntado tipo CG2.
- * Para casos en los que se requiera alta resistencia mecánica, estanqueidad y resistencia química utilizaremos material de rejuntado tipo RG1.
- * Se extenderá la pasta de rejuntado utilizando una llana de goma adecuada rellenando las juntas en todas su profundidad con movimientos diagonales.

LIMPIEZA

Con la nueva normativa UNE 138002:2017 de colocación cerámica de calidad, también se establecen pautas sobre la importancia de una correcta limpieza final de obra (capítulo 10.1): el colocador, una vez finalizada la colocación y el rejuntado, debe entregar el producto cerámico totalmente limpio. Y se entiende como producto cerámico toda la superficie que comprende no sólo las baldosas cerámicas sino también las juntas (de colocación y de movimiento) y otros materiales y sistemas complementarios. Según esta normativa se considera válido el proceso de limpieza cuando se cumplan las siguientes condiciones:

- a) eliminación completa de todos los residuos de la colocación
- b) el producto cerámico, en su totalidad no ha sufrido ningún daño.

Para satisfacer estas dos condiciones y considerada la complejidad y diversidad de los materiales que se utilizan tanto en pavimentos como en revestimientos en la decoración actual, recomendamos que este paso tan importante de limpieza se realice con detergentes adecuados y estudiados para que limpien en profundidad, sin dañar el material sobre el que se actúa, sin dañar ni cuartear las juntas, sin ser nocivo para la persona que lo utilice y sin dañar a otros elementos del conjunto de la decoración. Para el modelo Matrix recomendamos desincrustantes detergentes de base ligeramente ácida, como es el VIAKAL o productos de Fila como son el DETERDEK y FILAPHZERO.

Pero como sugerencia, al ser difícil conocer en exactitud la naturaleza de la mancha conviene realizar pruebas con diferentes detergentes, enjuagando la superficie con agua y secándola después de cada prueba.

CLEANING AND MAINTENANCE METALIZED PIECES

ASSEMBLED

The grouting operation has a big importance for the final result of the ceramic coating, as technically as aesthetically talking. The Grouting must be done with materials developed specifically for this purpose which are defined and classified in the UNE EN 13888 standard.

Due to it is a delicate product, you must be join carefully, trying not protrude above the ceramic material in order to prevent to stain it.

- * The grouting will be done after at least 24 hours from the placement of the ceramic pieces.
- * The application of grouting material will be carried out according to the manufacturer's instructions.
- * Normally we will use a grouting material type CG2.
- * For cases where high mechanical resistance, watertightness and chemical resistance are required, we will use grouting material type RG1.
- * The grout paste will be spread using a suitable rubber trowel which will fill the joints in all their depth with diagonal movements

CLEANING

With the new UNE 138002: 2017 regulation of installation the quality Ceramic. Moreover, guidelines also establish the importance of a correct final cleaning after work (Chapter 10.1): once the installation and grouting is finished, the ceramic product must be delivered totally clean. Keeping in mind that the regulation understand as a ceramic product the entire surface that comprise, not only ceramic tiles but also the joints (of placement and movement) and others complementary materials and systems. According to this regulation, the cleaning process is considered valid when the following conditions are obeyed:

- a) complete elimination of all waste from the placement
- b) the ceramic product, in its totally has not suffered any damage.

In order to satisfy these two conditions and considering the complexity and diversity of the materials that can be used, as pavements as coatings, we recommend that this cleaning step be carried out with suitable and studied detergents to clean thoroughly, without damage the material on which it acts, without damaging or cracking the joints, without being harmful to the person who is using it and without damaging other elements of the decoration set.

For the Matrix model, we recommend lightly acid based detergent descalers, such as VIAKAL or Fila products such as DETERDEK and FILAPHZERO.

But as a suggestion, since it is difficult to know exactly the nature of the stain, it is advisable to carry out tests with different detergents, rinsing the surface with water and drying it after each test.
